SIPAD Systems Purchases Laser

Alpharetta-based company adds laser cut stencils to their capabilities

10/5/2007 Alpharetta, GA. [SIPAD Systems Inc.](#) announced today that is has purchased a T-8 Fiber Laser bringing stencil manufacturing in house. With help from the Small Business Administration, SIPAD Systems secured the funding for the laser and associated support equipment to begin stencil production by January 2008.

The SIPAD process used a stencil to apply paste and over the last 2 years SIPAD Systems has purchased on average 20-30 stencils per month. "Bringing the process in house just made sense," said Matt Kehoe. "Faster response and cheaper prices are what keep our customers coming back. Just the money we'll save on the shipping will help make the laser affordable."

In addition to their own in house needs, SIPAD Systems will offer stencil manufacturing services to the local Atlanta market, as well as the Southeast US territory. "We don't have to corner the market on stencil manufacturing to be successful. We have a strong and unique and growing core business and we believe with a few key accounts we can provide a service currently not available on a local basis. SIPAD Systems will also offer inspection templates.

SIPAD solid solder deposit technology is a Siemens patented process that pre-applies solid solder to the surface mount pads on complex printed circuits. SIPAD Systems Inc. began operations in 2001 and is the first and only dedicated solder coating service bureau in the world, supplying solder coating services to OEM's, CEM's and printed circuit suppliers.
